

PROJECT REPORT

COS202 – Computer Programming II (Python)

Student Information

Name: OBANIJESU AKANJI

Matric Number: 241205008

Department: Information Systems

Course Title: Computer Programming II (Python)

Course Code: COS202

Project Title

Development of a Mathematical Calculator and Personal Pocket CGPA Calculator Using Python

Introduction

This project was carried out as part of the COS202 practical assignment. The aim was to develop two Python applications: a Mathematical Calculator and a Personal Pocket CGPA Calculator. These programs demonstrate the use of Python programming concepts such as variables, input/output, arithmetic operations, loops, and selection control statements.

Objectives

- Develop a simple mathematical calculator using Python.
- Develop a personal pocket CGPA calculator.
- Apply Python programming concepts to solve real-life problems.
- Improve programming and problem-solving skills.

Tools Used

Programming Language: Python 3

Development Environment: Pydroid 3

Project Description

1. Mathematical Calculator

A menu-driven application that performs addition, subtraction, multiplication, division, floor division, modulus, and exponentiation. It also includes Clear and Exit options.

2. Personal Pocket CGPA Calculator

Allows students to enter course grades and credit units, calculates GPA/CGPA, and displays the appropriate class of degree using Python selection control statements.

Conclusion

This project improved my understanding of Python programming by applying programming concepts to develop useful applications. It also enhanced my logical thinking and problem-solving abilities through practical implementation.
